

ABSTRACT

The present invention relates to an improved split-tip screwdriver. The split-tip screwdriver of the present invention prevents the movable sleeve from detaching from the remainder of the screwdriver by incorporating a retention rim on both the sleeve and the handle. The split-tip screwdriver also provides an extended portion on the sleeve that covers the elongated members and insulates the elongated members when the sleeve is extended from the handle to minimize the possibility of a user inadvertently being shocked by electricity conducted through the elongated members.
